
too often error message

Posted by radenko - 2013/12/29 15:27

I use notebook with Windows 7 64 bit and Rainlendar Pro 2.10 with connection to Google calendar. All is OK when I have Internet connection, but w/o Internet I received too often error messages (every 70 seconds). How to avoid message too often (how to get error message every 30 minutes, for example)? I do not want to suppress all errors.

The error are related to the polling frequency of the calendars. Unfortunately it's not possible to define how often the errors are shown so your option is either to suppress them altogether or keep them visible.

Can I adjust polling frequency? How?

The poll frequency can be changed from the calendar's settings. Note though that if the error happens because Rainlendar cannot connect to the network it will try again after a minute. Unfortunately this delay cannot be changed.
