## update todo list 2.12

Posted by Beat - 2014/01/01 13:05

---

I updated from 2.11 to 2.12 Pro

My todo list (which is not synced with the Google Task list) has disappeared. How can I find it again?

Thanks!

Is the window enabled (See that there is a checkmark on "Windows->Todo List")? Do you have any tasks which should be in the list? Does the manager show your tasks? If you have the "Hide list windows if there are no items" setting enabled the todo window won't show if it doesn't contain anything.

I have a slightly related problem.

The combobox to choose a task's calendar is empty. This doesn't apply to the Event List, just the ToDo List. Without that field filled, I'm unable to hit "OK" on the new task.

In Options > Skins > ToDo List > Settings, I select the calendar I wish to reference, in the include filter. That didn't help. Same outcome with the filters left blank.

The calendar I'm trying to reference is linked to a GMail account.

My apologies if you have to retread ground to give an answer. Thanks in advance.

You probably don't have any calendars which can store tasks. Note that in 2.12 the Google Tasks were moved to a separate plugin so if you were previously using them you need to add the Google Tasks calendar again in Rainlendar's options.

Thanks! That's exactly what I needed to do.

I did this and now I can see Googles tasks and calendar events. But there is a new problem:

I have some events and some tasks, which are stored in Rainlendar only (not in Google). After system start (even after hibernation) I see both types of events and tasks. After a refresh, the rainlendar tasks and events disappear, the Google tasks and events stay. Do I something wrong? -- Thanks!

Have you changed the location of the Default.ics file where the events are stored locally? Do you get any errors when you create local events?
