
Crash Adding Google Calendar (V3)

Posted by tonyjsan - 2014/01/09 11:39

new user to rainlendar, so far I like what I see. I am using 2.12 b136 64 bit, I do not have a pro key as I am testing it out, if I can get things to work for sure get the pro version.

I am attempting to add a Google calendar (v3), I enter the email, click select calendar, enter password, click login, the dialog box shows the google screen where one accepts / grants access to rainlendar, then crashes. Any help on resolving this appreciated.

I can use the Google Calendar (deprecated) and it works fines, however as it is deprecated would like to get v3 working.

Thanks in advance :) ,

Tony

You did not mention what operating system you have but if you are Linux user then yes, there is a Linux specific bug which causes a crash in the authentication dialog. The bug will be fixed in the next build.

I should have mention the os I'm using, yes I am using Linux openSUSE 12.3 64bit.

I look forward to the next build, so i can continue reviewing the software. So far I really like it.

The next build will be found in your beta section, or the regular download area ?

I'll probably do a bug fix version next so it'll be an official release (v2.12.1).
