## Can't move Events and Month Calendar independently

Posted by kenoodle - 2014/01/29 21:53

---

OS 10.7.5

Rainlendar Pro V 2.12.1 (b137)

Dual monitors

Since updating, I can't move Events and Month Calendar windows independently on the desktop. I can check which one to see, but if both are checked, one is in where I want it and the other is somewhere else. Moving one moves the other simultaneously. If I check to lock windows in place, they reboot in a different place from where I put them. Also, the icons are gone!

How can I download an older version?

If you keep shift key down when you move the windows all of them will be moved at the same time. If you just use your mouse without any keyboard button down you can move a single window as before.

Old versions are available from [here](#).
