
Rainlendar on Debian Stable Distros

Posted by rainman - 2014/03/19 00:47

I just wanted to let the developer and others know that as of the date of this post, you can only use Rainlendar v2.9 or lower on Debian Stable Linux distros because of the version of libc6 used. Higher versions of Rainlendar require a higher version of libc6 that is NOT in the Debian Stable repos. Just pulling in a newer version of libc6 is not an option because too many other packages are dependent on it.

Ubuntu does not use Debian Stable, so that's why the latest version of Rainlendar works for you. I also use Siduction, a distro based on Debian Unstable, and I am able to use the latest version on that distro.

I've just installed Debian Stable on my previously WinXP system.

Could someone kindly tell me which file to download to install Rainlendar? I have a Pro license.

<http://www.rainlendar.net/download/>

Thanks,

John.

You can try the newest version, from :

http://www.rainlendar.net/cms/index.php?option=com_rny_download&all=1

or download the older version :

http://www.rainlendar.net/download/rainlendar2-pro_2.9.b1111-1_amd64.deb

http://www.rainlendar.net/download/rainlendar2-pro_2.9.b1111-1_i386.deb

Thanks,

John.

Download the applicable v2.9 via the links provided by keepstudy. Any newer version of Rainlendar WILL NOT work on Debian Stable or one of it's derivatives at this point; ref. my OP.

@keepstudy...thank you for providing the links to v2.9 for both 32-bit and 64-bit. ;)
