
Global option for show/hide buttons

Posted by Oldorf - 2014/03/27 15:10

Suggestion

I like the feature of photos.xml and .lua where the buttons are hidden, when the mouse is not over the Photos window. It would be cool if this was a global behaviour for all buttons in all windows, making the Rainlendar look more clean (unless your mouse is over the window).
And the fact that the buttons are rarely used.

I know I could just add several scripts for each type of window and then set the visibility of each button.
But...

1. it would be hardcoded for each window type
2. for every addition/deletion of buttons, I would have to rewrite every button.

Re: Global option for show/hide buttons

I don't think hiding all buttons by default would work. For example the bullets in the to do list are buttons. This kind of functionality should be implemented by the skin which knows what controls can be hidden and which should remain always visible.

Ah ok, yep, that would definately not be smart, that would probably have made a whole lot of Kunena post :huh:
Thanks for the reply :)
