## Snooze for x

Posted by G.o.D - 2014/04/16 22:54

Hi,

Rainlendar definately needs some way to specify a certain snooze time, so you have your snooze for 10 minutes, snooze for 30 minutes, ... and a snooze for ... which opens a dialog to let you specify how many minutes/hours/days the current alarm should snooze.

The last item in Options > Advanced lets You add some items, for instance I add:  
", 1440, 10080, 0r"

To the list, for 1 day, 1 week and at event respectively. There You can also remove some seldom used items.

I know but this is not the same, i already have a good dozen defined and i still often find myself thinking... if i only would have 6 hours, or 48 hours, or 2 weeks, or 6 month, but if i now define it, i also have to define it on 5 other computers/partitions where i use rainlender and i'm sure i'll forget it so i just select something else (plus i need it now that the alert is there, not next time).

I just made a topic containing this very same request. It seems like the snooze options are unnecessarily difficult. I would much rather have a drop down list or on-the-fly snooze control rather than having to preset times that I may not desire to use for each alarm.

Second this request, i have too many preset times in my list, just because i may need some of them once per year.. I would leave only 5 often used ones and then can use customizable one when i need it.
