
Problems Copying Entries from Google to Local ICal

Posted by raven - 2014/05/08 02:30

Hello,
I am experiencing some trouble with copying entries from one calendar to another. When I try to copy entries from my Google Calendar into a local ICal-calendar by using the manager, Rainlendar would copy all selected entries but would then start to delete the entries from the target calendar again (one by one, about one per second) until only one entry is left. This happens both when offline copies are enabled or disabled. Maybe there is some setting preventing duplicate entries, but I have never come across any comparable problem although I used parallel online and offline calendars on several occasions in the past, so this might also be a bug. I use Rainlendar Pro's current stable release. I am hoping for some helpful responses.
Cheers

Not yet get reply:

a) As upstairs said. And I found, not only cannot copy events/tasks from google to local, but also not working fine if copy events/tasks from local to google.

b) Week numbers incorrect, in Savannah - Week view.

a) The events gets copied but it is removed immediately after that. I'll check what's causing it.

b) Week number adjustment doesn't work if there is other text than just '%W' in the format string. I'll fix that.
