## Google Events

Posted by Dhrun - 2014/05/17 19:00

---

Until I last updated this worked fine.

I have a Google tasks list that used to show and sync with the events on Rainlendar.

Now the Rainlendar is blank. If I click on a new event the drop down menu to select a calendar does not give the Google one as an option.

The events are not visible in the manager.

You need to create the Google tasks calendar again since they are not part of the "Google Calendar" anymore. Go to Options->Calendars, Click Add and choose "Google Tasks" as the type of the calendar.

how can I specify where to put the offline copy of the calendar? I have a D drive, which is my backup drive, and I would like to put my calendar file there.

Thanks  
Michael

The offline calendars are written to the backup folder. You can change that with the --backup command line argument.

Thanks for your reply, is this the only way? Is there anywhere you can specify in settings or configuration?

You can also make a portable installation and put whole Rainlendar on your backup drive. But those are pretty much the

---

only options.

Thanks for your reply. If I have Win 8.1 and would like to use the backup copy of offline calendar, are these the steps that I should do?

- 1) disable auto-startup in Task Manager (right now Rainlendar is started automatically by Task Manager)
- 2) create a shortcut in Win 8.1 startup folder (C:\Users\Michael\AppData\Roaming\Microsoft\Windows\Start Menu\Programs\Startup)
- 3) in this shortcut, specify the command as follows:  
C:\Rainlendar2\Rainlendar2.exe --backup=D:\xxx (where my backup copy is located).
- 4) the next time I start OS, the it should pickup the new backup file in D

ps: what if I change Start in to my D where my offline copy is located will it do the same?

If I put the offline calendar in D, how do I sync my Google calendar with this copy in D?

Thanks

Yes, those steps should be enough. The "Start in" setting in the shortcut has no functionality with Rainlendar so you need to always define the path with the command line argument. The sync always uses the offline file from the backup folder. It's automatic and it doesn't matter where it is located.
