## Categorie filter?!

Posted by plegs - 2007/02/06 12:06

---

Hi,

First of all thanks for this great application.  
I have a question about the categories.

Is it possible to categorize the events after special words in the event description?

Maybe if I had found something like Work in the description it should be categorized in the work category.  
I already found the hint that rainlendar supports scripting. Is this language just for skinning or can I use it for my request too?

Greetings  
plegs

That is not possible. You have to set the categories manually.

The scripting is currently used only to add functionality to the skins but I have plans to extend the support. So, it probably will be possible to make modifications to the events with the scripts in the future.

You can do this with Autohotkey:  
<http://www.autohotkey.com/docs/Hotstrings.htm>.

A quick example. It works but I can't get the category to capitalize for some reason and I'm too lazy to fix it.

```
#persistent
::birthday::
ifwinactive Event
{
    send Birthday
    controlsend Edit8,{bs 15}Birthday,Event
}
```
