
Is there still a server available?

Posted by dikkydik - 2007/02/09 06:42

Hi,

In version 1.x there was an server module available.

An exeutable that was the central point in a LAN environment, where a central calendar could be shared between several LAN clients...

Is such a module still available in version 2?

Regards, Dikky Dik

Rainlendar2 can use standard web or ftp server to store the calendar.

So, no dedicated server is available, any web share medium should be used, from where you can access a physical file that represent the shared calendar?

Is that conclusion correct?

It can download calendar files from any server that supports http, https or ftp protocol. If you want also to upload files you need a webserver with webdav extension (or ftp server).
