
old ini format and space between days in eventlist

Posted by bilbo_b - 2007/03/10 03:42

How can i grow space between the days in the event list, with a skin in the old ini format ? When i edit the paramter EventListSeparation, then space between all the events and the date (all the entrys) are growing. when i edit EventListHeaderSeparation, then space between the date and the events for this date is growing, but i want more space between the last entry of the first date and the title for the next date.

how can this be done ?

The EventListHeaderSeparation should change the distance of the last item and the next header instead of the header and its first item. It's a bug in Rainlendar2. I'll fix it.
