
Replace EVENTS

Posted by scott32746 - 2007/04/23 11:22

Hello,

Is there a way to replace/rename EVENTS and TODO to something more useful for me ?

You mean the "events" and "todo" texts? I guess you could create a new language file which translates them to something else.

Hello,

What I am looking at is change EVENTS: to PERSONAL: and TODO: to WORK:. I do not need to change the language if you are talking from English to Spanish as an example

he ment to take the english translation file and make a copy of it (ie. my-translation) then edit the place in the copy where it displays the EVENT text to whatever you want.
then you use your "translation" copy in the program.

Yes, and if you just want to change the texts in the skin you can do that with some paint application. Check the Rainlendar's help file for details how to edit the skins.

Hello,

I am unable to find "english translation file". Would you be able to point it out to me. Thank you

There is no English translation. You have to create such yourself. You can download the .pot file from the language page and use poEdit to "translate" the strings you want and create the .mo file from it. Then create e.g. "en_US" folder to Rainlendar's locale folder and copy the rainlendar2.mo file to there.

It seems that local language can be installed, one of two ways:

1:

Since Rainlendar only needs the MO file in ..."\locale\da_DK\
one could install the Danish language file, like this:

Create the folder "\da_DK\" and copy or move the MO file.

or

2:

Double click the "Danish.r2lang" file, Rainlendar would install Danish language, e.g. it create the folder "\da_DK\" with the two files: "rainlendar2.mo", and "rainlendar2.po"

Change Language, e.x:

Open Rainlendar, right click the photo horse, and say: Options, General, Language: Danish

If you double click the not needed PO file, it would open in poEdit (if thats installed).

After I downloaded poEdit, I modified a very bad translation (the headings "Event List", and "Todo List"), like this:

Double click the PO file "locale\da_DK\rainlendar2.po" (to open in poEdit). Press Ctrl+F, String to find: Event list, Click Next. When that item was found,

I simply substituted the bad translated words with my new words (left bottom window).

Repeated the Ctrl+F key press, and said: String to find: Todo List,...

(the words "Todo List" was substituted twice).

Close poEdit (Catalog modified. Do you want to save changes?)

Yes

Open Rainlendar and saw that both the "Event List" and "Todo List" was now better translated :-), but this time I didn't deleted the PO file, ofcause.

In other words, if the PO file is modified, Rainlendar would modify (create a new) binary MO file.

I would be a very bad idea to just re-translate a language file.

I only substituted the two headings, one "Event List", and two times substituted the heading "Todo List".

I could now ZIP my new MO and PO file, and rename that ZIP file to "New_Danish.r2lang".

Benny
