Script Support is now solved :-)

[http://www.rainlendar.net/cms/components/com\\_joomlboard/uploaded/images/v21\\_horse.jpg](http://www.rainlendar.net/cms/components/com_joomlboard/uploaded/images/v21_horse.jpg)

Edit: September 2, 2007

Rainy have now shown me a better method, so wee can just forget the below CMD file "install\_lua". Instead wee could download my latest version 1.21, which include that better method.

Anyway; I leave the previous version 1.2, here:

Mirror (ZIP),

<http://www.photoshopelementsuser.com/forum/showthread.php?p=301174#post301174>

Download the "install\_lua.cmd" for WinXP, and use something like this,

```
<button id="Calendar.button.manager" action="Global_ShowDialog(Manager)" />
```

Benny,

Btw.: Use Notepad (no problems here).

Content of "install\_lua.cmd":

Install script support for our XML files.

```
@echo off& setlocal enableextensions enabledelayedexpansion
```

```
REM "install_lua.cmd" by Benny Pedersen, August 31, 2007.
```

```
echo.
```

```
(set f="%ProgramFiles%\Rainlendar2\scripts\windows.lua"Â«Â»)
```

```
(if not exist %f% set f="%~dp0scripts\windows.lua"Â«Â»)
```

```
if exist %f% (
```

```
find /i "function Global_ShowDialog(dialogName)"< %f% >nul
```

```
if not errorlevel 1 (
```

```
echo Script Support is installed.
```

```
) else (
```

```
if not "%~1" == "###" (
```

```
echo Installing Script Support.
```

```
echo.>> %f%
```

```
echo function Global_ShowDialog^(dialogName^)>> %f%
```

```
echo Rainlendar_OpenDialog^(dialogName^)>> %f%
```

```
echo end>> %f%
```

```
echo.>> %f%
```

```
if "%~1" == "#" "%~f0" "###"
```

```
find /i "function Global_ShowDialog(dialogName)"< %f% >nul
```

```
if errorlevel 1 (
```

```
cls& echo.& echo Removing Write Protection.
```

```
attrib -r %f%
```

```
)
```

```
"%~f0" "#"
```

```
)
```

```
)
```

```
) else (echo Failure:
```

```
echo.
```

```
echo "%~nx0" should NOT be executed in
```

```
echo "%~dp0"
```

```
echo but in
```

```
echo Programs folder, and:
```

```
echo "Rainlendar2\"
```

```
echo.
```

```
echo Try again: Please copy or move "%~n0" into the "Rainlendar2" folder.
```

```
)
```

```
echo.& pause
```

But as said, the above script is not needed because a better method was found and then included in the updated Horse Skin v1.21 ...
