## problems on linux

Posted by brett - 2006/11/06 16:21

---

Thanks for making the Linux version. Unfortunately it's not working for me. When I run the executable nothing happens. It doesn't return as if it were running the main loop but I don't see anything and don't get any messages. I've tried both "rainlendar2 --verbose" and "rainlendar2 --debug" and nothing.

well everything's not perfect in paradise.

the taskbar/notification icon doesn't show up in gnome if you're starting it in your from your session startup list. seems like rainlendar might be trying to add it's icon before the notification area has finished starting up.

there's also some funny refresh errors.

other than these minor annoyances it's nice to have rainlendar in linux.
