## digiclock options

Posted by drm - 2006/11/07 11:37

---

I am trying to show multiple digiclocks to display date with month abbr, time, day-of-week. like the old rainmeter could.

I can use the codes %m %d %y to get numeric month,day and year, but the old %B or %b to show month name is not working but leaving spaces.

The day of week codes %a or %A also do not work.

Am I missing some options or are these choices just not available?

The digiclock in Shadow4 uses images so it cannot shown anything else but numbers.

the format option of %p shows am or pm and that works.

That's because the bitmap font includes images for 'p' and 'a'. You could of course add the other characters to the font too but with fixed spacing the text probably wouldn't look very good.

If you want to have text in the clock you can change it to use a real font instead of the image. You'll lose the shadow effect though.
