## Rainlendar 2.2 build 50

Posted by Rainy - 2007/11/11 14:06

---

Build 50 can be downloaded from here:

Windows: Rainlendar-2.2.b50.zip

Linux TAR: Rainlendar-2.2.b50.tar.bz2

Linux DEB: rainlendar2-pro\_2.2.b50-1\_i386.deb

This is beta version! It has not been tested.

- o Fixed a resource leak in the Windows version.
- o Snooze and dismiss menu items didn't work in the alarm window. Fixed.
- o Printing showed incorrect month in the title when year changed. Fixed.
- o Templates didn't work correctly unless the name was lower case. Fixed.
- o Scaling images down uses now bicubic resampling (i.e. the result is much better than before).
- o Added indentation support for the first line of the multiline texts.
- o Fixed skin and language installation on Linux when the user doesn't have privileges.

I've been having a few problems with Rainlendar since build 49. Here's what I've found:

<http://img80.imageshack.us/img80/4985/84567208pc9.th.jpg>

- When you right click on a day in the calendar, the menu contains no text.

- Certain events (in my case - one particular event on Saturday) do not appear when using Google Calendar.

- Certain recurring events in Google Calendar have lost their categorization within Rainlendar since the update to build 49.

After about 20 seconds of testing, I can confirm this build seems to have fixed the disappearing rainlendar windows problem I (and others) reported for the previous build.

One slightly oddity... in my ToDo window, as well as a 'bullet' before each entry, I also get the jigsaw icon that the Chromophore skin (which I'm using) usually uses for entries in the events window.

hi, first of all let me thank you for your work!

I am running Rainlendar on Gutsy Gibbon with compiz-fusion obviously :P , it was already dead easy to use, but now with the .deb it's fantastic!

However just to let you know, rainlendar always goes back to the middle of the screen, every times i tried to attribute it a place, at refresh it goes back to original place.

Many thanks! :lol:

Hi,

I have tested this release regarding the bug I've reported here.

But this problem is still there.

Great job with b50lite (and b49lite also)! I was very glad to see the native Compiz transparency finally added, and b50lite works perfectly for me in Ubuntu Gutsy. However, font rendering on Linux still has a ways to go, and some of the text in the Event and Todo lists looks a bit off, so I was wondering if there is a way to tweak the font settings for Rainlendar or the skin I am using (Shadow4)?

I don't know what you mean by a bit off everything looks fine on my end, but you can edit the skins XML files to change the font used.
