## Orange numbers for the shadow skin?

Posted by Spankey - 2008/01/15 05:09

---

Hi all,

Is someone capable to make orange numbers for the shadow4 skin. And perhaps also purple. That gives a bigger variety of choice in number colors when you are editing / personalizing the skin events (for instance when you are matching your outlook events with rainlendar).

Thnx!

Perhaps it's a suggestion to create an option in the shadow skin that you can choose / create your own colours in the calander window of the shadow4 skin by edditing the elements file. Just like you are able to change the colour of the tekst in the events window (by adjusting the "255,100,100,255" code in the script).

I guess you could do something like this with the hue attribute but since the numbers are just png images and Rainlendar is not an image editor it's not possible to define the colors with rgb values.

You would have to edit the skin manually. There are instructions in the help file how to do this. The hue is an attribute for the bitmaps which can be found from the elements.xml. Check the Chromophore skin as it already uses it to change the color of the background images.
