
Unable to open rainlendar

Posted by bonbon - 2008/02/19 18:55

As seen here this always occurs when i try to start up rainlendar, and re-installing didnt help..

See the FAQ MSVCR71.dll (or MSVCP71.dll) was not found?

The 1.1 framework isnt helping. I have 1.1, 2.0 service pack 1, 3.0 service pack 1, and 3.5 installed. Of Dot net framework

I also have MS Visual C++ 2005 sp1 Redist
and
MS Visual C++ 2008 Redist x86 9.0.30304
installed as well.

ive tried putting the DLL in question in the install dir of rainlendar.
windows dir
windows/system dir
and system32 dir.

Still does not work.

I just formatted yesterday. ie7 and SP3 for winXP

I lost a bunch of extremely important data when I updated from version 1 to version 2. and now this is going on. I backed up my profile in
C:\Documents and Settings:Towely\.rainlendar2

now again losing a ton of so much very very important data.

If there is a solution you see to this please let me know.

Can I safely uninstall all the frameworks and reinstall them?

C++ causing conflicts?

I'm at a loss here.

Time to find something else a little more reliable to store my important dates and data :(

I love rainlendar. I hate to lose it.

Thank you
Deano

There is no need to install any frameworks or extra dlls anymore. The dll files which were missing from the previous versions have been included in the Rainlendar version 2.3 installer.

nevermind.. Woohoo thank you so much. it works and all my important information is there.

Thank you for the fast reply.
