## Restoring from backup...

Posted by kunkel321 - 2008/05/05 21:48

---

Hi, I'm using the pro version. I use it with Outlook 2007. I plug-in to my company's exchange server from multiple locations, so I uninstalled, then reinstalled r2 in full 'portable' mode. Usually (maybe 75% of the time) r2 will remember it's settings from location to location, but the rest (25%) of the time it reverts to factory default, and totally loses its settings (though it does remember which skins are installed). I've noticed that there are 5 backup archives in the r2 Program Files. I can't seem to utilize the backups though. How do I import/install a backup file? I've tried various - command switches. Does the backup even contain settings, or is it just a backup of PIM data? Is there some way for me to fix my Rainlendar? I really like the app, but it's basically unusable in it's current state (or at least a HUGE time drain setting it up a couple times per week).... Thanks. -steve

The files in the backup are just zip which contains the settings, your license and the local events. If you want to restore them you need to do that manually by overwriting the files. If you do a backup from the Manager (File->Backup) you can use the Restore option.

The settings are stored in a file called Rainlendar2.ini which in portable installation is in the program folder. Could you check what happens to this file when you lose all your settings (it's a text file so you can open it with a text editor)?
