
Rainlendar 2.3 build 59

Posted by Rainy - 2008/05/17 12:07

Build 59 can be downloaded from here:

Windows: Rainlendar-2.3.b59.zip

Linux TAR: Rainlendar-2.3.b59.tar.bz2

Linux DEB: rainlendar2-pro_2.3.b59-1_i386.deb

Mac OS X (Intel): Rainlendar-2.3.b59.dmg

The Mac version should work in OS X 10.4 Tiger now too.

This is beta version! It has not been tested.

- o Skin addons do not have to share the skin's name anymore. The addon can define the skin in a file called "skin".
 - o Script timers weren't deleted on the refresh which caused a crash. Fixed.
 - o Disabled menus on Mac when the Options dialog is active.
 - o Network shared calendars can choose to use either basic or digest authentication.
 - o Changed the Google calendar plugin to always use secure connection.
 - o Calendars are automatically reloaded when resuming from suspend. Works only on Windows and Mac though. The resume delay can be changed from the advanced options.
 - o Added support for global events in Lua scripts.
 - o Changed scripts to use libcurl when downloading data from the net.
-

I've got a warning from Nod32 about possible virus while downloading the zip package:

```
http://www.rainlendar.net/download/Rainlendar-2.3.b59.zip
probably unknown NewHeur_PE virus
connection terminated - quarantined
Threat was detected upon access to web by the application:
E:\Programs\FirefoxPortable2\App\firefox\firefox.exe.
```

I tried to download the other beta versions since b55 and there was no warnings.

The Nod32's heuristics seem to give a lot of false positives. There isn't much else I can do about it except to suggest to use some other anti-virus application.

OK, no problem with me, I've just tried to be helpful :)

Free AVG reports it as a Generic Trojan.

=====

Re:Rainlendar 2.3 build 59

Posted by Rainy - 2008/06/01 13:58

I ran the zip through the Jotti's malware scan and out of 20 different antivirus application 3 thinks that there is a virus.

The reason probably is the UPX compressor which I'll have to stop using since these false positives give bad reputation to the application (and I don't have high hopes that the antivirus companies would actually fix their products).

=====

Re:Rainlendar 2.3 build 59

Posted by eyebex - 2008/06/02 09:03

In fact I also had AVG report a false positive, and I even sent in the file for an analysis, but they still claimed it was a correct detection. So you're probably right being better off with working around the problem on your side :-/

Maybe I'm annoying but transparency: Copy is still not working correctly on linux and the problem with tooltips about I was writing here:

http://www.rainlendar.net/cms/index.php?option=com_kunena&Itemid=36&func=view&id=5283&catid=7#5283 is still not fixed too.

If You fix this two errors this would be for me the top of happines :).

About transparency problem: Maybe try do transparency copy like the Conky application is doing it. It's working all day with refreshing every 2 seconds and there is no such problems like with rainlendar.

And about this tooltips... only I have this problem...? I was updating the system, drivers, gnome libraries, X server and nothing helped :/

How do you install the beta on Tiger? When I try to it says that there is nothing to mount.

=====

Re:Rainlendar 2.3 build 59

Posted by Rainy - 2008/06/07 10:07

brajan: Conky uses the wallpaper as its background to make the window "transparent". It works quite well if the window is always on the desktop but it doesn't work if the windows overlap each other (like Rainlendar's tooltips). There seems to be some Linux specific issues with the Rainlendar's window updating code which I haven't been able to fix. The code is basically the same in all platforms and the Windows and Mac versions work fine so I'm not exactly sure why it causes problems in Linux.

Ben_Stone: Mounting problems usually mean that you downloaded only a part of the package so try to download it again. If you still get the error please post the exact error message.

Re:Rainlendar 2.3 build 59

Posted by Ben_Stone - 2008/06/07 19:49

I fixed it. I had to remove the .bz 2 extension from the file name and use dmg.

Win XP SP2

I install Rainlendar Lite 2.3 (b55) Works fine.

I install Beta b.58 (by overwriting, new Rainlendar.exe presents). Works fine.

I install Beta b.59 (by overwriting, new Rainlendar.exe not present). Oops!

Invalid plugins found!

The following files in Rainlendar's plugins folder are invalid and should be removed:

C:\Program Files\Rainlendar2\Plugins\GooglePlugin.dll

C:\Program Files\Rainlendar2\Plugins\CalendarPlugin.dll

C:\Program Files\Rainlendar2\Plugins\IniFormatPlugin.dll

C:\Program Files\Rainlendar2\Plugins\NetworkPlugin.dll

C:\Program Files\Rainlendar2\Plugins\OutlookPlugin.dll

Make sure that all the plugins are the same Rainlendar version.

After this installation Rainlendar not show plugins in About window and my Events and ToDos.

Posted by Rainy - 2008/06/09 12:26

You should try installing the b59 again. I haven't heard that anyone else has had this kind of problems with the build so something probably went wrong when you overwrote the files.

Re:Rainlendar 2.3 build 59

Posted by Alexander - 2008/06/11 02:47

The reason of my problem is NOD32 antivirus system.

I turn it off, but kernel stay active permanently.

NOD32 deletes rainlendar.exe file during unzip of build 59 folder (without any warnings in turn off mode).

So latest Rainlendar beta installation for NOD32 users is possible only in Windows safe mode or after removing of NOD32 :(

Wow! Rainlendar for the mac. Thank you for a great job rainy!

I hope syncing with iCal will soon be possible, than you will have yourself a new happy customer :)

Okay found out how to sync with iCal using the ICalexchange website. works great!. Is it possible to register this beta version of rainlendar so the tags are removed?

I have been happily running build 56 for the past couple of months but after a power failure today, all my events have disappeared. How do I recover them? (I have Time Machine running so do have access to everything before the power failure) Thanks Richard (Running on leopard Mac)

Re:Rainlendar 2.3 build 59

Posted by Rainy - 2008/06/28 06:18

The events ("Default.ics"-file) are stored to a hidden folder called .rainlendar2 in your home folder.

Posted by Serpentor - 2008/06/28 11:28

Rainy, I am with snowman. I have been running Rainlendar 2.3 b59 on Mac OS X 10.5.3 for a couple of weeks now and it all runs great! If I buy and register Rainlendar, can I use that registration with the Mac version of Rainlendar and will it remove the tabs from my Google calendar items?

Thanks,
Serpentor

Yes, the license files work in the Mac version too.

I've the same problem. I've use Rainlendar before, the program is already on this computer before I use it. Then I download the lite version (2.10-32bit) this morning, and found warning msg everytime I try to running the program (the program can still running but will always have this warning msg before).

I'm not sure what the problem is, but before I'm running the program this morning, first I'm installing some Rainlendar skins, one of them detected by antivirus have trojan on it.

http://www.rainlendar.net/cms/images/fbfiles/images/warning_msg.jpg

Welcome to the forum, rapaelh.

Then I download the lite version (2.10-32bit) this morning, and found warning msg everytime I try to running the program (the program can still running but will always have this warning msg before). It's not bugs, it's because you download Lite version, it not support Network Calendar and Outlook.

You can do this :

- 1) Ignore the warning message and continue to use the Lite.
 - 2) Delete them from "C:\Program Files\Rainlendar2\plugins\" and continue to use the Lite.
 - 3) Download and use the Pro version.
