## Event list scripts

Posted by mhf - 2006/11/13 15:33

---

I put this script into EventlistHeaderFormat : %A %x to get (e.g.) Friday 01/12/2006 and then added # before the x hoping to take out the zero, but got this : Friday 01 December 2006 - I like it but would still like to take out the zero...!

The # works only with the codes that return a single value. You need to compose the date from the different components:  
%#d/%m/%Y
