## extended desktop windows position bug

Posted by theradio - 2006/11/14 14:54

---

I experienced a strange behavior when using Rainlendar set "on desktop" position, then extending the destop to a second screen.

first, the various items did not "stick" where I put them, and finally all rainlendar windows disappeared. I checked in the .ini file and I found weird X and Y positions (i.e -7333 and -946)

It seems that it happens only with the "on desktop" mode enabled in rainlendar.

regards

What build are you using? If it's not the build 26 get it from the beta forum and try it again. You should also change the transparency from "Native" to "Copy".

Mostly On Desktop works on build 26, but there is a smallish new bug. When it changes date it isn't redrawn where I placed it. Instead it is placed within an x-coordinate according to the resolution of monitor #1 (which in my case is a 800x600 TV). As monitor #2 -- where Rainlendar is at the far right of the screen -- is 1200x1024, it's a bit annoying.

An addition to this bug..

I also face the same problem and have tried to download the latest Beta build as well as the default download. This seems to help somewhat. After install the 3 tabs appear in the top left corner stacked (I can barely see their corners and drag them). OK - once I move them to their correct positions and go to Options -> Lock then they are again thrown to the upperleft corner. No idea why. I tried putting on desktop, on top but same result. Locking them throws them to the corner.
