
Daylight saving time

Posted by aleantonello - 2006/11/18 10:23

Hi. Here in Brazil the day light saving time doesn't have a fixed date to start or end. So, I manually configure my PC when to start and end the time changes (I do this every year to keep my clock precise). What happens is that Rainlendar shows November 4 two times (the day light saving time started at November 5, midnight), Saturday and Sunday of the same month. This means that all following days falls at wrong week days. This is happing only in November window. December window shows month days and week days at right place. Could this behavior be some kind of bug? There is a way to fix that? I'm afraid that, when day light saving time ends, at February 25, this will happen again.

Hi, Rainy.

Yesterday I installed the new version (2.0.1) and the problem remains the same. I don't know, for sure, by reading the changes notes, if you already look to find out what is happening but, the day when DST started still are doubled. I'm attaching an image to show you how its looking today.

Can you contact me privately (rainy@iki.fi)? I haven't been able to reproduce this myself so I need to create few test builds for you to figure out where things go wrong.
