## Convert old skin to new format

Posted by gelegrodan - 2008/10/01 17:29

---

Hello

Is there some easy way to convert old skins to the new format?

I guess there is no easy way =/

But how do I know how I should "translate" the old code-format to the new one?

For example:

```
TodoFont=-11/0/0/0/400/0/0/0/0/3/2/1/34/Calibri
```

And the new one looks something like this:

```
appearance element = "font.normal" color = "102, 35, 36" align = "TOP-LEFT"
```

How do I know how to convert?

=====

Rainlendar does convert the ini-format skins to the new format internally so I guess some kind of automatic conversion tool would be possible to implement. I'll have to think about this.

Here is info what all the other values mean but note that not everything is supported by Rainlendar2:
