## Addon installation failed Error (Ubuntu)

Posted by MartijnPuts - 2008/10/13 18:44

---

Hello, I installed Rainlendar on my Linux Ubuntu. I saw the Shadow 4 Widgets addon and I was amazed! I tried to install it on all the different ways I know but I just keep getting the same error and I cannot load the extra layouts in the setting (advanced) window. Please help!

Ps. Other skins do install (That's the strange thing about it)

Hello,  
I have the same error but on WindowsXP.  
I tried to install the folder "Shadow4-Widgets.r2skin-addon" but it failed. It seems to not exist (that's what the error text says).  
I need some help.  
Thanks.

MartijnPuts, can you try installing the addon from the command line?

```
sudo /usr/bin/rainlendar2 -i Shadow4-Widgets.r2skin-addon
```

If that fails too please start Rainlendar in debug mode (rainlendar2 --debug) and try the addon installation again. The debug log should contain some error which might explain what goes wrong. You can open the debug log from the Rainlendar's context menu when it is in the debug mode.
