Widget addon
Posted by nefa - 2008/10/15 13:10

_____

Hi, Rainy!
Thank you very much for the program and the addon!
How can I adjust the PHOTO from a folder on my computer?
Can I use the addon in my skin?

_____

You need to get the latest version of the addon:
http://www.rainlendar.net/cms/index.php?option=com_kunena&Itemid=36&func=view&id=6164&catid=6

It has a setting to define also a local folder for the photos.

Yes, the scripts and other content from the addon can be used in other skins too.

_____

I can't understand why I was able to get this widget package to work on one pc and not another when I did them both the same way. Any ideas? Should I un-install and re-install?

_____

The addon may not install properly if it has been already installed to the skin or if there has been any other changes in it.
So, reinstallation of Rainlendar and the addon is probably worth to try.

_____

I played around a bit with the photos widget and have one question:
Is it possbile to set up multiple photos windows to show images from different sources (say, one from flickr as usual and one from local hard disk)?

_____

Yes, it should be possible to open several windows at the same time. The settings should be written to different places in

the configuration file so you can configure them individually. I haven't tested this though with the Photos widget so I cannot guarantee that it works (but I can fix it if it doesn't work :-)).

_____

Hi Rainy,

could you give me a link for how to configure the multiple windows with different contents so that I can read it and try?

_____

You can just move the window multiple times to the active side in the advanced skin options. But I just tried it and it doesn't seem to work properly. I'll have to check that out.

_____

I have a problem with the add-on package: I want to use the "File" box, but it makes my Rainlendar constantly crash. Anytime I have to refresh Rainlendar (adding a new event, etc.), it crashes, and this ONLY happens when I am using the "File" box form the add-on. Any suggestions? Thank you!

_____

Is it related what the file widget is showing or does it crash with any file? Can you try the latest beta build and if it crashes with that too send me (rainy@iki.fi) the crash log?
