## Widget

Posted by knowbase - 2008/10/25 03:56

---

How do we create our own widgets for our own skin(s)? I want to create my own countdown widget, like that of the Shadow4 widget, except with some alterations. I couldn't find anything on it. Is it possible to create and script our own?

The widgets are normal skins which just show something else in the windows than a calendar or event/todo lists. There aren't any tutorials or other docs especially written for the widgets so pretty much the only way to learn about the widgets is to check how the Shadow4 Widgets have been made. The description of the API functions which can be used in the Lua scripts can be found from the Rainlendar's help file.
