## Categorie-Selection - Don't Work

Posted by Cesideem - 2006/11/19 08:35

---

Hi there,

I have a problem with showing Events with spezial categories.

That's what I do:

Thunderbird 1.5.0.8 with Lightning 0.3

I got an Networkcalender there.

In Thunderbird I created several categories for me.

Now I create a new Event an asign on of the categories to that (e.g. categorie "test").

In the Rainlendar settings I renamed the default categories according to the created Thunderbird categories.

Now, at the calendar-tab, I select my test-categorie from the dropdown menu, so that only this categorie shall be displayed in Rainlendar.

After confirming changes and reloading refreshing Rainlendar, all events are displayed - not only the test-event.

Where is my mistake?

The "Visual Category" does not filter the events. It defines the appearance of the events in that particular calendar. Filtering is not possible at the moment but it is planned for the future versions.

Hello from Germany...

Its possible. I have a XDA neo (HTC Prophet) with Windows Mobile 5. It syncs with Thunderbird Adressbook and Mozilla Calendar via Java Client-Server Programm called Finchsync. It works great. YOu can find Finchsync under <http://www.finchsync.com/>
