A little Rainmeter help...

Posted by poisonborz - 2008/11/23 03:16
_____

Hola, I know it's a bit off topic by now, but please help, there is no place I could turn with this.

I found an rss-based gmail-notifier skin for rainmeter, which extracts the info in the following form:
 (html wraps   replaced with { and })

Measure=Plugin
Plugin=Plugins\WebParser.dll
UpdateRate=#Update#
Url=#Url#
RegExp="(?siU){fullcount}(.*){/fullcount}(.+{title}.+{/title}|)"
StringIndex=1

Since {fullcount} wraps the number of mails, a string can display it like Text="%1 new mail"

What I want to do is to hide this string in case of zero... but how can I measure the value/string index %1? If I guess right, I have to associate an appropriate IfBelowValue with the string value with the action below...but how?

Thanks in advance

Can you post a link to the skin?

_____

Sorry, sure

http://autotveszek.hu/pbgmail.ini

 fetches the rss, then the 6 meters below extracts the mail subject, then writes the mail amount. I want to hide in case %1 (fullcount in rss) is below 1

Try this. The WebParser checks the IfBelow/IfAbove values only when it updates but routing the result through the Calc seems to work better. There is a 1 sec delay though before the title is shown/hidden.

Thanks a lot, it works great!
Defeats the point what everyone shouted at me elsewhere, to move on to litestep for these kind of things :)

I'm sorry but I have been looking for an email notifier for a week now. This one (rainy's pbgmail) looks good but I don't know where to place it. I have Rainmeter and Rainlendar2. I have tranquil, 10 foot hud, and hud.vision skins for rainmeter. Sorry if this is way after discussion but it would really be helpful.

Thanks

_____

Place the script in a subfolder of Rainmeters skins folder...

C:\\Program Files\\Rainmeter\\Skins\\pbgmail
