## Overview

Posted by Southward - 2008/11/28 10:15

---

Can someone provide a high-level overview of the relationship between the scripts and skins? I am interested in creating a skin to include a task list and the ability to log time spent on each activity by clicking a button. I have worked through the skinning tutorial, downloaded Lua and I'm working through the Lua tutorials now. Would someone be able to give me a description of what functionality belongs where?

Thanks!

I'm not exactly sure what kind of overview you are looking for but basically all functionality is done by the scripts. E.g. when you click a button a script will be executed which will then do something (hide/show items in the skin, change the current month, open a dialog, ...). If I have time I can add a chapter about the scripts to the tutorial too.
