Rainmeter TopProcess question, please...

Posted by Mike the K - 2008/11/29 22:50

_____

Hi. I'm just using the example from the Rainmeter help file to show the name of the process using the most CPU time, but all I get is "0%". I've customized a few other skins, but this new one is giving me trouble... Any help would be appreciated, -Mike.

_____

Nothing? Can anyone look at the ini file in the previous post and let me know why it might not be working? In the spirit of the holidays? Thanks, -Mike.

_____

I tried the config and at least in my computer it works fine (except that the meter doesn't define any dimensions so the text gets cut). Does the About dialog show zero values for the meters too?

_____

I added width and height to the meter, and it works OK.

W=125
H=20

_____

It shows you the name of the top process other than "idle?" Maybe the dll is incompatible with my processor; I have an AMD Athlon 64 X2 Dual... I'll try to look up the plugin and see if I can find any info...

And thanks for trying it! If anyone has any ideas I'd appreciate a hand. Maybe MBM...

Have a good one, -Mike.

_____

...Rainy, I now see that you wrote all the processor-related Rainmeter plugins. Should AdvancedCPU work with an Athlon 64 X2? If not, could another plugin return top process names? If anyone has something like this or can point me in the right direction I'd appreciate it. Thanks again, -Mike.

_____

Do you use the 64-bit version? There is one (if you didn't know). :cheer:

_____

No, I'm on XP Home 32-bit. Do you think that's where the problem is?

Thanks, -Mike.

_____

I don't know...
And BTW, I was talking about the Rainmeter 64-bit version... Maybe you could try it out? :dry:

_____

The plugin just reads the performance meters from Windows so there shouldn't be anything processor specific in it. Does the Windows performance meter (Control Panel->Administrative Tools->Performance) work ok in your system?

_____

Arne,

   I knew you were talking about Rainmeter 64;
   I thought I couldn't run 64-bit apps on a 32-bit OS. :blush:

Rainy,

   Windows performance meter works fine (although I'll check
   again when I get home). And I'm successfully using bits of
   the Simplicity skin to report overall cpu, ram and swap usage.

Neither of you added ANY code (aside from W & H),to get it to
work? I've never made a skin, so I could be making some very
basic mistake...

Thanks again for responding, -Mike.
