## Display Biggest RAM User

Posted by cakefu - 2008/12/17 14:52

---

Hi, new to the boards -- but I've been searched through it and Google and can't seem to find a solution yet...

I'm aware of the TopProcess measure/method (not used to the terminology yet) that can get you the most CPU intensive process being run. However, I once had a Vista sidebar gadget that displayed the biggest memory hog active and found that very useful to keep the notebook running snappy. Is there a means in Rainmeter/Rainlendar that I can duplicate this notifier?

Thanks!

=====

The highest cpu usage is hard coded to the plugin so it cannot show other information similar way. So, the plugin would have to be changed to make that possible.
