## Programmatically adding calendars to rainlendar?

Posted by MoonJihad - 2009/01/07 22:53

Hi!

I'm working on a task management which can export data in iCalendar format(see the screenshot below). I can point Rainlendar towards the exported calendar and have it automatically refresh the data.

However, I'd like to automatically add the calendar to Rainlendar from my application, so that having Rainlendar support in my application means that the user only needs to click a button rather than having to enter a calendar path, then add the calendar to rainlendar, then set it as read-only and monitor it for changes and then group the todo list by category.

I see that Rainlendar has support for executing scripts from the commandline. Is there documentation somewhere?

The reference documentation for the scripting API can be found from the Rainlendar's help file but it doesn't allow you to modify the calendars at the moment. I'll add the feature to my backlog.
