
Rainmeter Weather

Posted by TDC02 - 2009/01/09 22:36

How do I get rainmeter weather to work on Vista 64bit? I follow all the information in the INI and I keep get an error.

how do I change the weather to read Corinth, TX. 76210. I made a copy of the New YORK.IDI and save it as Corinth.IDI, but I keep get an error. I change all the information in:

URL=http://www.rssweather.com/wx/us/tx/corinth/rss.php?
URL2=http://www.rssweather.com/wx/us/tx/corinth/wx.php
HideAll=

So, what is the error you get?

When I look at the Rainmeter Notepad log, I see this.

```
DEBUG: (00:32:28.125) WebParser: Finished URL: http://www.rssweather.com/wx/us/tx/corinth/rss.php  
DEBUG: (00:32:28.125) WebParser: Matching error! (-1)
```

and also

```
DEBUG: (00:35:32.299) WebParser: Finished URL: http://www.rssweather.com/wx/us/tx/corinth/rss.php  
DEBUG: (00:35:32.299) WebParser: Not enough substrings!
```

Thank you.

I wonder if the format has been changed. Does the original config still work?

I am having the same problem with the weather configs.

The log shows the same "not enough substrings" error.

It gives the same error no matter which config I use. Which leads me to believe that the problem is with the format of the RSS feed.

Does anyone have an updated ini, or patch for the new format?

Thanks in advance
