## Too many substrings

Posted by Kebas - 2009/01/22 03:57

---

I'd like to get all the information from weather.com.

Although the logfile says "too many substrings". It seems there is a max of 99 substrings.

I tried to solve this with a second regexp and stringindex2, but I can't get it to work.

Would somebody please explain the working of stringindex2? And am I on the right way to solve this with stringindex2 or are there better solutions?

Thanks very much in advance.

Jacob.
