## bad bubbles position

Posted by weepie - 2006/11/23 03:42

---

I use rainlendar on my notebook and sometimes I have problem with bubbles position.

When I extend my screen for second monitor, the position of bubbles are bad.

On the image is EVENT list and bubble position when I set cursor position on text "test"

Does it help if you restart Rainlendar? If not, can you tell how your monitors are set up and where is the Rainlendar's event list located.

If you mean Exit rainlendar and run it again, yes, it helps. And if you mean Refresh in menu, no, it does not help.

And in previous post I forgot write, that it is not only problem with event list. The bubbles are bad in To Do list, calendar and bubbles for try icon - every bubbles.

My guess is that the framework checks the screen layout only when the application is started. I'm not sure there is anything I can do about this.
