
win7 and \"on desktop\" feature

Posted by brnmtf - 2009/01/25 17:14

is there any work going on for supporting win7?

so far i've noticed only one thing what's not working - "on desktop" feature.

I tried Rainlendar on the Windows 7 and at least without the Aero desktop the "On desktop" seems to be working. I have the OS installed to a vmware so I cannot try it with the Aero enabled. Windows 7 seems to keep the widgets visible when the desktop is shown so there might be some other way to implement the feature too but I haven't found any information how to do it.

i can confirm this problem in a standard install of the beta (build 7000)

i have aero on. when switching on the 'stay on desktop' feature, rainlendar (and rainmeter for that matter) disappear. using the 'stay on bottom' setting brings them back, but they disappear when the desktop is shown or when using 'aero peek'

hopefully when windows 7 goes RTM they'll release info on how to do this! it's frustrating to have to minimize all windows manually to see my calendar :)
