## Calendar Colours

Posted by draconas - 2006/11/23 07:03

---

Just upgraded to rainlendar 2, I have it reading ics files originally created in mozilla sunbird.

With 1.x it read them fine and colour coded the events based on the event type - all was good.

Rainlendar 2 isn't colouring - everything is in blue irrespective of the event category. It is reading the categories ok because the bithdays show up with a star and trips get a plane etc...

Rainlendar is using the default shadow skin with default settings, i haven't seen a "colour events by category" option, am I just being blind?

Running Windows XP SP2

What categories does it use? Perhaps there is no appearance defined for them in the skin file?

---

Same event categories as had been used in the 1.4 version - i had my ics settings pruned so that i could only add rainlendar-compatible categories.

Have just added a birthday using rainlendar. The Category is called Birthday - it gets the little star icon but the date is coloured blue.

Ahh yes, having opened up the skin file - you've changed all the colour schemes.

Righty... sorry for wasting the time, need to find a new skin now.
