## How can I parse a string

Posted by turwaith - 2009/03/08 13:00

---

I would like to be able to parse a string read in from the registry, but can't seem to find a way to do it without making my own plugin (which would be overkill for something that simple).

I tried to trick the webparser into parsing out the string for me, but it seems that only other webparser measures can be used in the url.

```
Measure=Registry
RegKey=Software\Microsoft\VisualStudio\9.0\ProjectMRUList
RegHKey=HKEY_CURRENT_USER
RegValue=File1
```

```
Measure=Plugin
Plugin=Plugins\WebParser.dll
Url=
RegExp="(?!\\)(+)(?=\.)"
Codepage=0
Download=1
UpdateRate=30
StringIndex=1
```

Any ideas?

That won't work because the webparser cannot access other measures except its own. I don't think that's possible at the moment but the regexp for substitute enhancement would probably work. If it will be implemented that is.

That's what I kind of thought, I'm trying to add the webparser's regexp to the registry measure now.
