## Clickable buttons for days and todo items

Posted by Galt - 2009/03/22 23:43

---

I'm having fun modifying Rainlendar skins to fit my own needs, but there are two things I'd like to do I can't figure out how to do:

- 1) When a day in the calendar is clicked, that day becomes "today" (and the days displayed in the events list are correspondingly changed).
- 2) When an image next to a To Do item is clicked, the item is either deleted or changed to completed.

I'm sure these must be possible with either Global\_ functions or with scripting, but I can't find a guide that explains enough of these functions to get me there...any help from other script/skin experts?

Thanks!

1. The event list shows the events from your current day as set in the operating system so you would have to change your system date. This isn't possible with Rainlendar and probably not something you would want to do.
2. At the moment it is not possible to change the event or task properties with the scripts. This is a planned feature though.
