## Position change

Posted by mafiaconfidant - 2009/04/03 23:10

---

Hi, I've only been using Rainmeter for a few days so I certainly don't know much about it, and I haven't done more than dabbled in code ever.

My question relates to the configs changing position after I open any sort of game. The problem, I'm pretty sure, is that the games run at a much lower resolution than my display, but I can't raise the game res to my display res and I don't want to lower my display res.

Pretty much after I open any game any config I have near the bottom or right side of the screen move up and left. I'm wondering if there is anyway to keep them in position despite the resolution changes.

Any advice welcome, thank you.

Try the latest build. It allows you to define the location of the windows relative to the screen edges.

How safe is the new build, is it stable enough for general use?
