
Self-made skin won't show in Ubuntu

Posted by RazzleDazzle - 2009/04/07 13:25

I followed the skinning tutorial in Rainlendar's Help section, used gedit (and kate just to make sure) to make the code, and saved it as skin.xml (edit: I don't know why those underscores are showing up, I didn't type them) in /usr/share/rainlendar2/skins/Nahka.

When I go into Rainlendar's Options>Skins I still only have Chromophore and Shadow4 available.

My code is lifted straight from the tutorial, so I know that's not the issue.

Any ideas?

Check the Rainlendar's debug log. It should contain an error describing why the skin cannot be loaded.
